Project Name: Linux User, Group & Job Scheduling Management System

Project Discription:

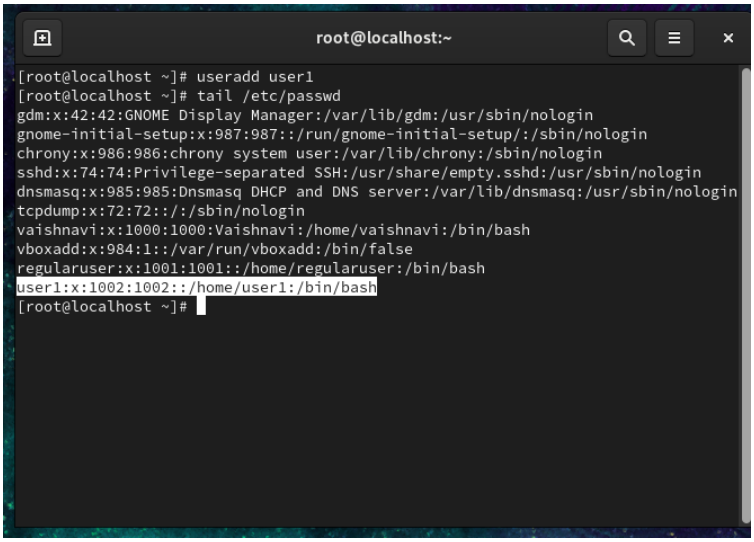
This project is based on Linux system administration and simulates real-time tasks performed by a system administrator. It focuses on managing users, groups, and scheduling automated jobs using cron. The project helps in understanding core Linux administration concepts used in production environments.

Skills Gained

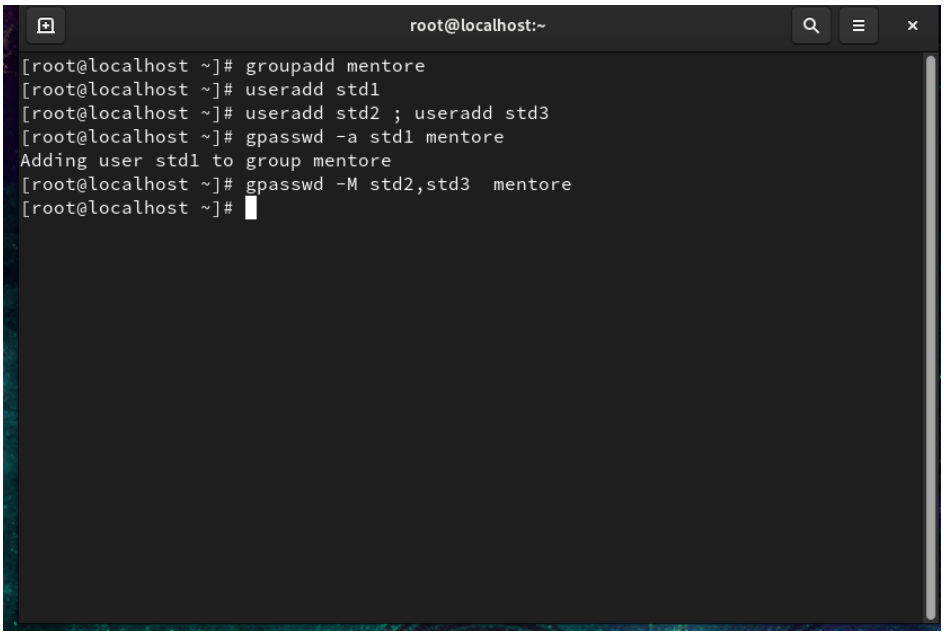
- Creating and managing users using `useradd`, `usermod`, and `userdel`
- Creating, modifying, and deleting groups using `groupadd`, `groupmod`, and `groupdel`
- Understanding system, root, and regular user roles
- Modifying user properties such as username
- Add users to group
- Remove users from group
- Viewing and verifying user and group information
- Renaming users and groups

1. Creating and managing users using `useradd`, `usermod`, and `userdel`

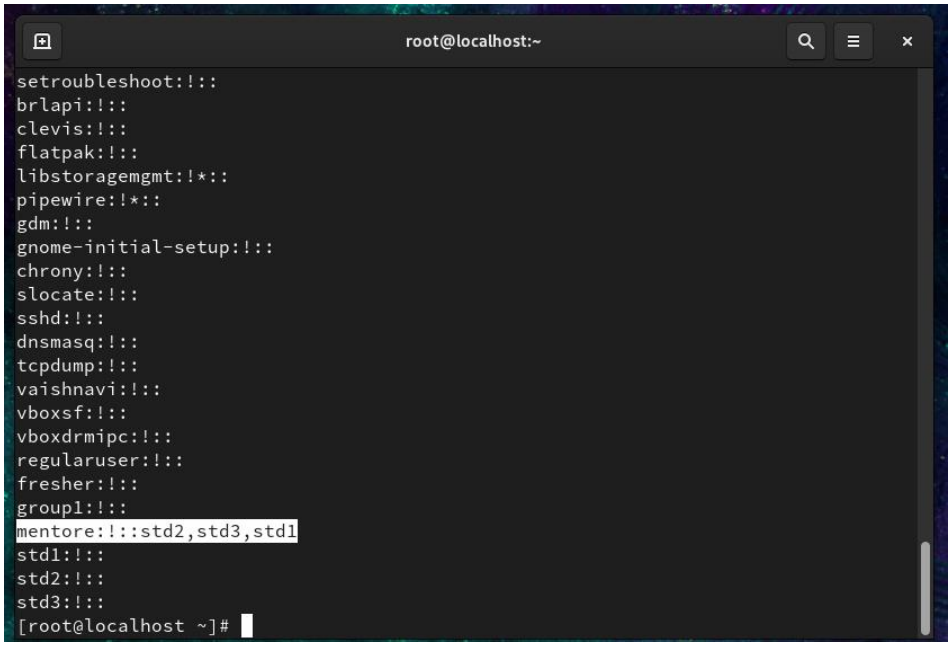
- Add users using **useradd** and show users using **cat /etc/passwd**



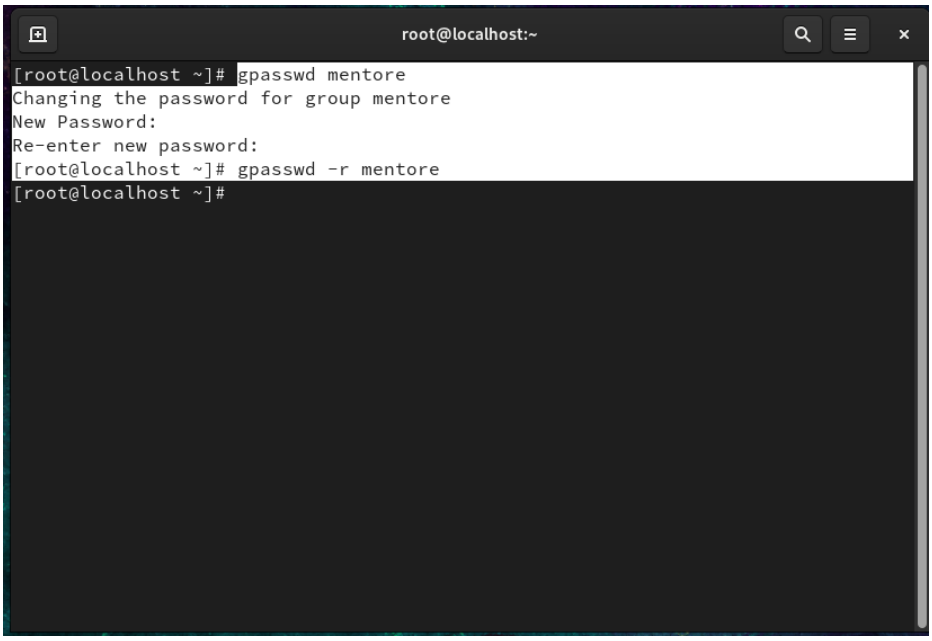
2. Add Group using groupadd command
   - We can add a user to group using **gpasswd –a**
   - We can add multiple user to group using **gpasswd –M**



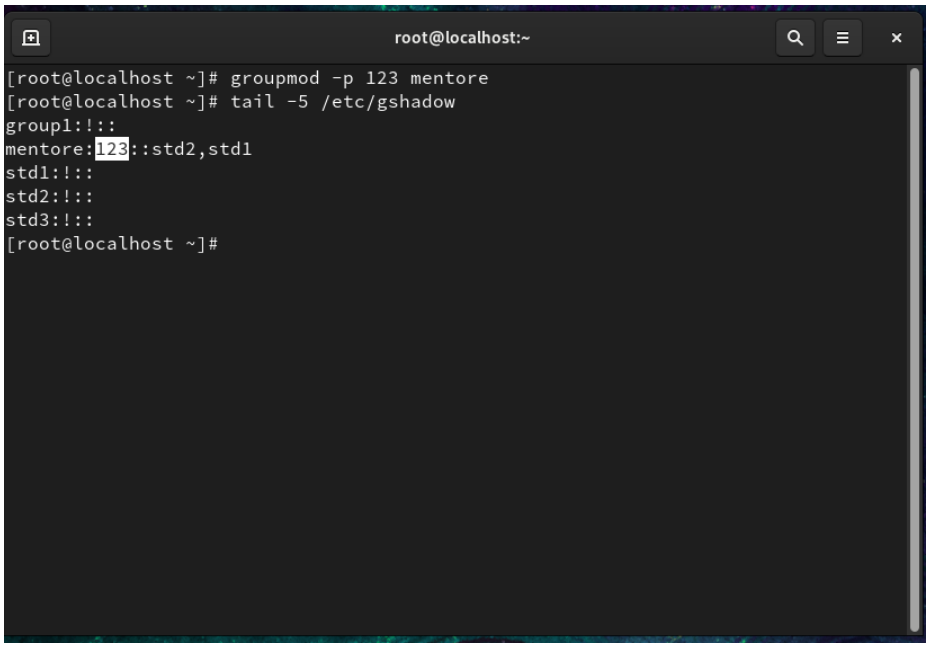
3. After adding this users to mentore Group:



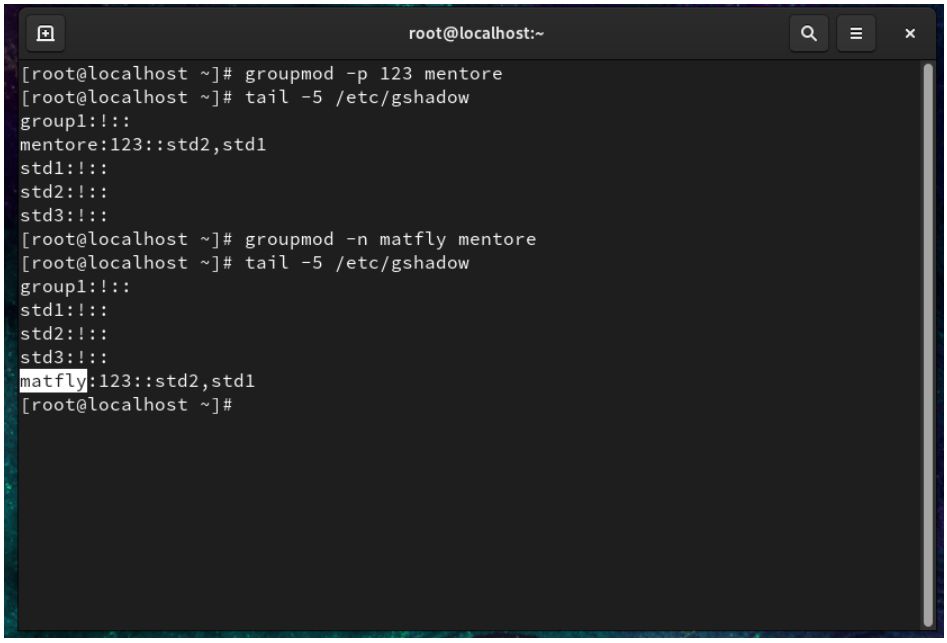
4. Assign or change password using **gpasswd**



5. Another way of giving password is **groupmod –p 123 mentore**



6. Change Group name using **groupmod –n ‘newname’ ‘oldname’**



7. Remove user from group using gpasswd –d ‘username’ ‘groupname’
